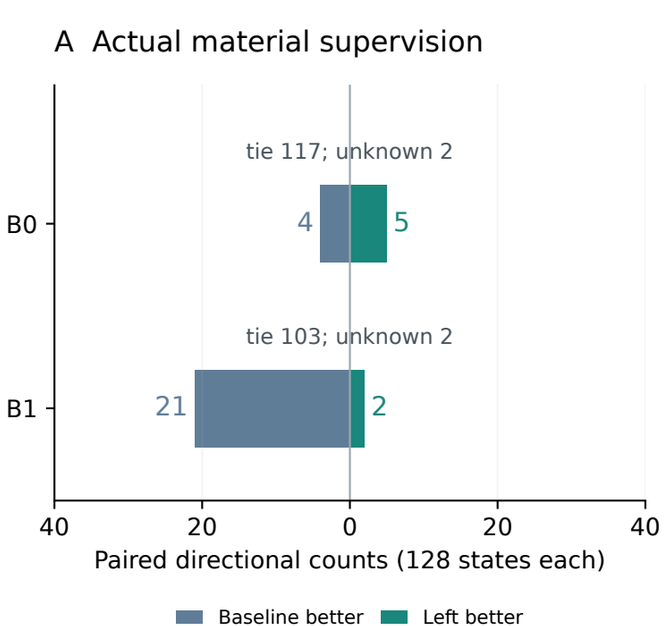
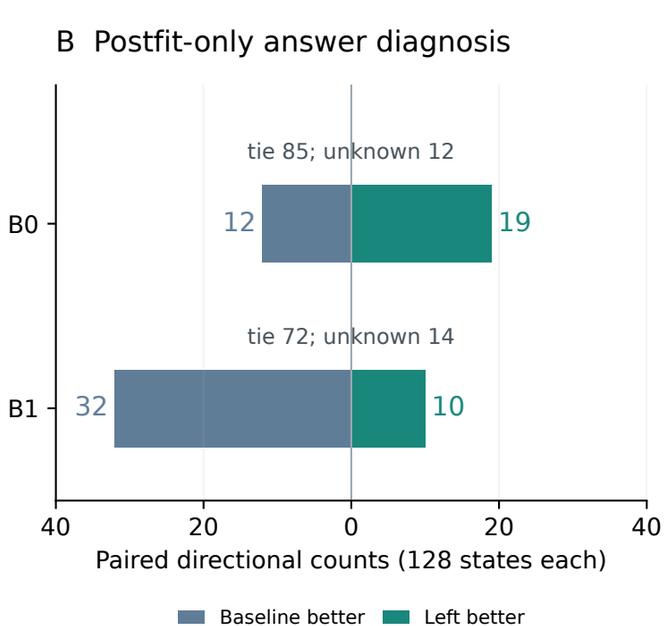
B64: material supervision, later answer diagnosis and first Host outcomes

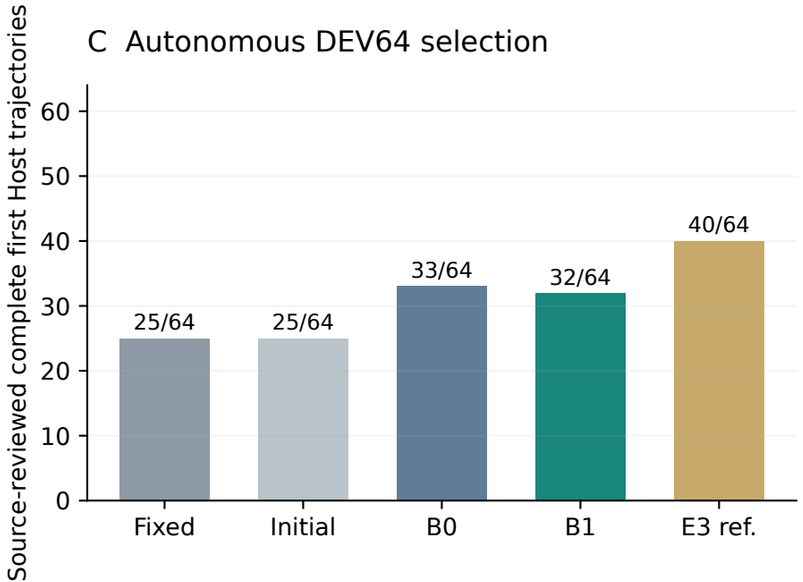
128 matched states | one shared baseline | 384 original binding outcomes | no label backfill



New answer targets stayed unknown in both fits.



Source-author first answers; not new training labels.



B1-B0: -1.56 pp; gains 12 / losses 13 / ties 39.
Family bootstrap 95%: [-17.19, +14.06] pp.
Development selection; no adoption.

Left = argmax for B0; coverage alternative for B1. Shared baseline executed once. Different full bindings remain distinct even when literal packets match.
Source-author judgments, exposed development and first stochastic outcomes. Material tiers do not establish Host success, collector efficiency or independent confirmation.
