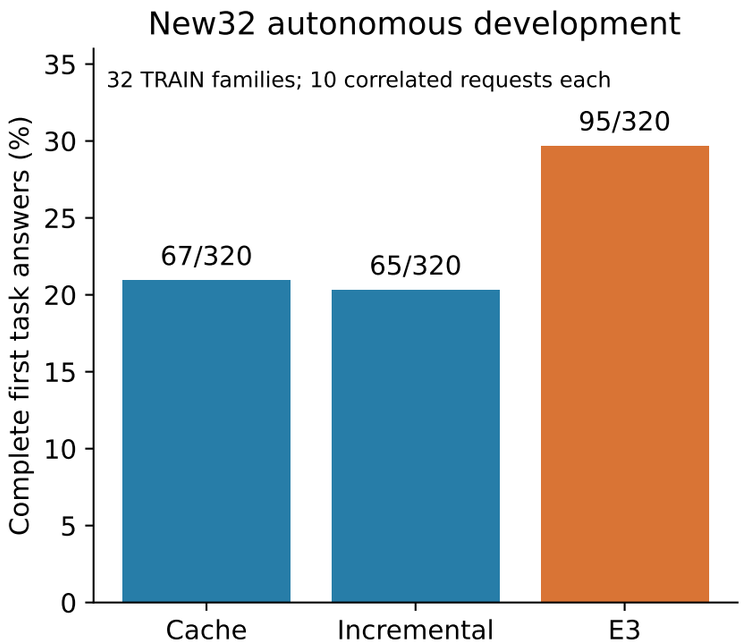
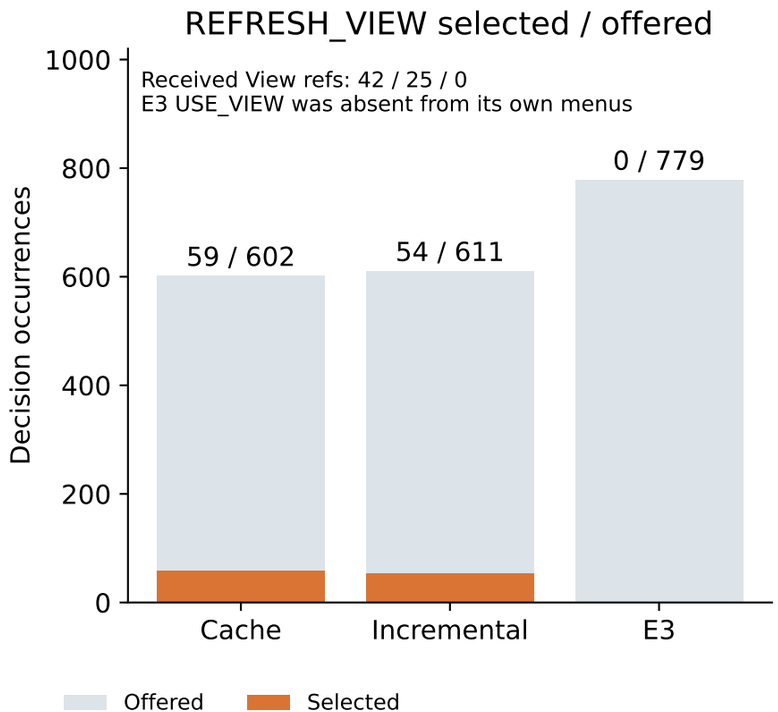
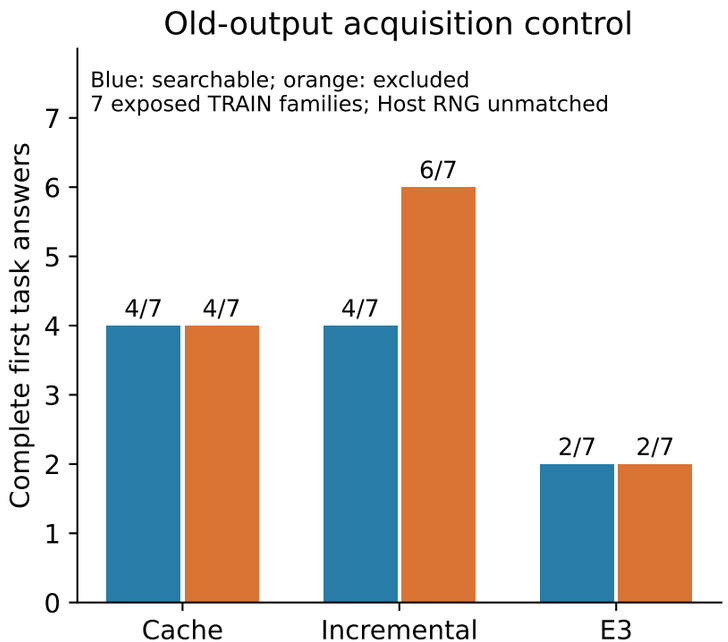
D: task results, actual View decisions and conditional output acquisition are separate







Known-View control: 0/9 complete; one first template rejection was never dispatched and is not a policy-attributable loss.
All first failures remain: old-output includes two unchanged full-input capacity failures; existing Host knowledge stays common in both conditions.
Source-author review is not independent/blind. New32 results are conditional/descriptive; zero View receipt does not establish learned View reuse.
